DECORATING – BEST WAYS TO PRINT YOUR BRAND!

DEBOSS process involves imprinting on specific substrates with a metal stamp, customized with the desired imprint. Using the proper amount of heat, time and pressure, the final result is an elegantly decorated item with a permanent imprint.

EMBROIDERY is the art of decorating fabric or other materials with needle and thread or yarn. Embroidery pricing is based upon the number of stitches in the logo (regardless of how many colors).

LASER ENGRAVING utilizes a powerful laser beam to engrave a substrate surface, most typically metal. Laser oxidation is available on items when the surface and the item are the same color. The imprint turns black with oxidation.

PAD PRINTING transfers ink via a silicone pad onto a substrate. With this print method and the unique properties of the silicone pad, we are able to transfer images to a variety of surfaces.

SCREEN PRINT OR SILK SCREEN allows ink to be transferred through a mesh screen. A squeegee forces the ink through the screen and onto the substrate material to be printed on. Silk screen pricing is based on the number of colors in the imprint.

DIGITAL DIRECT PRINTING produces vibrant, full-color images using special UV printing technology. Printing can be done on rigid, flat plastics and metals, allowing multi-color imprints and photographic representations complete with a full bleed.

HEAT TRANSFER involves printing the artwork onto a carrier sheet. The sheet is then firmly pressed against the item with a heat press to transfer the artwork permanently to the item. This process allows for full-color imprinting.

DYE SUBLIMATION digitally prints on a special material that is transferred via a heat press to the final synthetic substrate (typically polyester fabric). The ink bonds with the fabric to create a vibrant and permanent imprint that embeds onto the item.

EPOXY DOMES enhance the vinyl inserts process by adding a clear resin cap to your imprints, giving them an amazing glossy, 3D effect to your items. Epoxy domes have an added bonus of providing a protective barrier for a lasting imprint.

VINYL INSERTS are where logos are digitally imprinted on a vinyl, pressure-sensitive substrate.
